## NEWS RELEASE

### Morningbird Completes STTR Phase I Contract for NASA

**Huntsville, Alabama, USA, June 30, 2017** — Morningbird Media Corporation has completed a 12-month small business technology transfer (STTR) Phase I contract with NASA. The contract, (NNX16CM40P) "Development of Additive Manufacturing Techniques for the Production of Electronic Devices," funded the development of the Electronic Alchemy 3De printer prototypes versions 0.1 and 0.2.

Electronic Alchemy is a 3D printing system that will be the first of its kind to produce functional electronic devices. Soon toys, games, gadgets, communication devices, drones, sensors, robots, and much more, will be able to be designed by and printed by consumers. The version 0.2 prototype is a multi material printer using proprietary materials and processes to create a myriad of devices for commercial, government, academic, and recreational uses.

The mission of Morningbird Media is to enable innovation. The Electronic Alchemy 3De Printer system will consist of a printer, the EA Design Cauldron and layout software, multi-material cartridges, and membership into a design community that will allow consumers to find and download designs, as well as contribute their own.

Morningbird Media is working to continue its relationship with NASA, with the hopes of creating 3D printing systems that would produce many of the critical devices needed for NASA's exploratory mission.
